

SINGLE-CELL Li-ION CHARGE MANAGEMENT IC WITH TIMER-ENABLE FOR PDAs AND INTERNET APPLIANCES

FEATURES

- **Highly Integrated Solution With FET Pass Transistor and Reverse-Blocking Schottky and Thermal Protection**
- **Timer-Enable Function That Allows Host to Disable Charge Timer and Termination When Charge Current Is Shared With a Load or When Battery Is Absent**
- **Integrated Voltage and Current Regulation With Programmable Charge Current**
- **High-Accuracy Voltage Regulation ($\pm 1\%$)**
- **conditioning, the bq2400x applies a constant-charge current to the battery. An external sense-resistor sets the magnitude of the current. The constant-current phase is maintained until the battery reaches the charge-regulation voltage. The bq2400x then transitionsto the constant voltage phase. The user can configure the device for cells with either coke or graphiteanodes. The accuracy ofthe voltage regulation is better than $\pm 1\%$ over the operating junction temperature and supply voltage range.**

Charge is terminated by maximum time or minimum taper current detection

The bq2400x automatically restarts the charge if the battery voltage falls below an internal recharge threshold.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PowerPAD is a trademark of Texas Instruments.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ORDERING INFORMATION

T _J	PACKAGE		CHARGE STATUS CONFIGURATION
	20-LEAD HTTSOP PowerPAD™ (PWP)(1)	20-LEAD 5 mm × 5 mm MLP (RGW)(2)	
–40°C to 125°C	bq24007PWP	bq24007RGW	Single LED
	bq24008PWP	Not available	Single bicolor LED

(1) The PWP package is available taped and reeled. Add R suffix to device type (e.g. bq24007PWPR) to order. Quantities 2500 devices per reel.

(2) The RGW package is available taped and reeled. Add R suffix to device type (e.g. bq24007RGWR) to order. Quantities 3000 devices per reel.

PACKAGE DISSIPATION RATINGS

PACKAGE	θ _{JA}	θ _{JC}	T _A ≤ 25°C POWER RATING	DERATING FACTOR ABOVE T _A = 25°C
PWP(1)	30.88°C/W	1.19°C/W	3.238 W	0.0324W/°C
RGW(2)	31.41°C/W	1.25°C/W	3.183 W	0.0318W/°C

(1) This data is based on using the JEDEC high-K board and topside traces, top and bottom thermal pad (6,5 × 3,4 mm), internal 1 oz power and ground planes, 8 thermal via underneath the die connecting to ground plane.

(2) This data is based on using the JEDEC high-K board and topside traces, top and bottom thermal pad (3,25 × 3,25 mm), internal 1 oz power and ground planes, 9 thermal via underneath the die connecting to ground plane.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range unless otherwise noted⁽¹⁾

	bq24007 bq24008
Supply voltage (V _{CC} with respect to GND)	13.5 V
Input voltage (IN, ISNS, TMR EN, APG/THERM/CR/STAT1/STAT2, VSENSE, TMR SEL, VSEL) (all with respect to GND)	13.5 V
Output current (OUT pins)	2 A
Output sink/source current (STAT1 and STAT2)	10 mA
Operating free-air temperature range, T _A	–40°C to 70°C
Storage temperature range, T _{stg}	–65°C to 150°C
Junction temperature range, T _J	–40°C to 125°C
Lead temperature (Soldering, 10 s)	300°C

(1) Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

APPLICATION INFORMATION

Figure 12. Single-Cell Li-Ion/Li-PoI Charger With Safety Timer Disabled

- If the TMR SEL pin is left floating (3 HR time), a 10-pF capacitor should be installed between TMR SEL and CR.
- If a micro process is monitoring the STAT pins, it may be necessary to add some hysteresis into the feedback to prevent the STAT pins from cycling while crossing the taper detect threshold (usually less than one half second). See SLUU083 EVM or SLUU113 EVM for additional resistors used for the STAT pins.

APPLICATION INFORMATION

FUNCTIONAL DESCRIPTION

The bq2400x supports a precision current- and voltage-regulated Li-Ion charging system suitable for cells with either coke or graphite anodes. See Figure 13 for a typical charge profile and Figures 14 and 15 for an operational flowchart.

Figure 14. Operational Flow Chart With the Charge Termination Timers Enabled (TMR EN = 0)

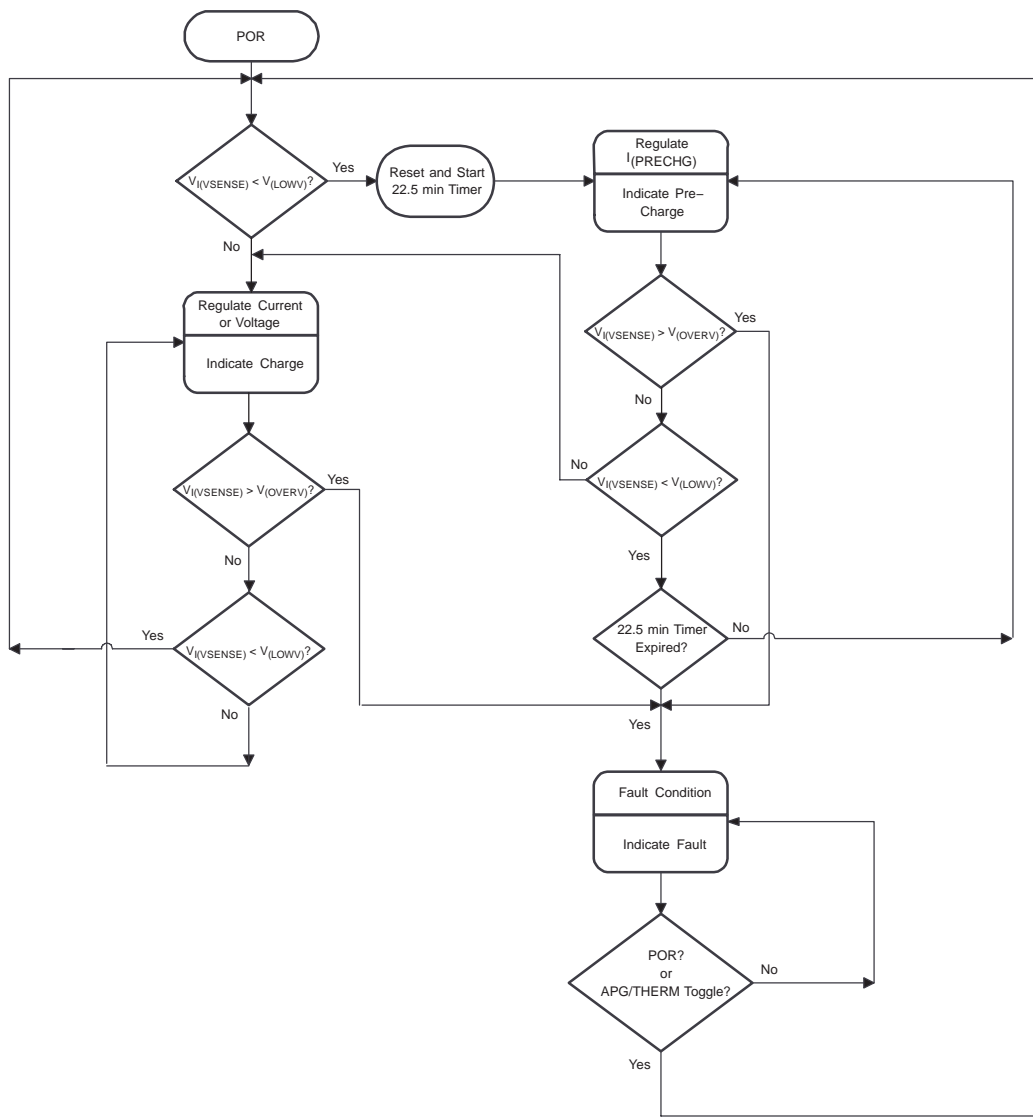

Figure 15. Operational Flow Chart With the Charge Timers Disabled ($\overline{\text{TMR EN}} = 1$)

Charge Qualification and Preconditioning

The bq2400x starts a charge cycle when power is applied while a battery is present. Charge qualification is based on battery voltage and the APG/THERM input.

As shown in the block diagram, the internal LowV comparator output prevents fast-charging a deeply depleted battery. When set, charging current is provided by a dedicated precharge current source. The precharge timer limits the precharge duration. The precharge current also minimizes heat dissipation in the pass element during the initial stage of charge.

either the adapter power or the battery temperature using a thermistor. The bq2400x suspends charge if this input is outside the limits set by the user. Please refer to the APG/THERM input section fo

The APG/THERM input can also be configured to monitor

APG/THERM Input

The bq400x continuously monitors temperature or system input voltage by measuring the voltage between the APG/THERM (adapter power good/thermistor) and GND. For temperature, a negative- or a positive- temperature

coefficient thermistor (NTC, PTC) and an external voltage divider typically develop this voltage. (See Figure 16.) The bq2400x compares this voltage against its internal V_{TP1} and V_{TP2} thresholds to determine if charging is allowed. (See Figure 17.)

Figure 16. Temperature Sensing Circuit

If the charger designs incorporate a thermistor, the resistor divider RT1 and RT2 is calculated by using the following two equations.

First, calculate RT2.

$$RT2 = \frac{V_B R_H R_C \left[\frac{1}{V_C} - \frac{1}{V_H} \right]}{R_H \left(\frac{V_B}{V_H} - 1 \right) - R_C \left(\frac{V_B}{V_C} - 1 \right)}$$

then use the resistor value to find RT1.

$$RT1 = \frac{\frac{V_B}{V_C} - 1}{\frac{1}{RT2} + \frac{1}{R_C}}$$

Where:

$$V_B = V_{CR} \text{ (bias voltage)}$$

R_H = Resistance of the thermistor at the desired hot trip threshold

R_C = Resistance of the thermistor at the desired cold trip threshold

V_H = VP2 or the lower APG trip threshold

V_C = VP2 or the upper APG trip threshold

RT1 = Top resistor in the divider string

RT2 = Bottom resistor in the divider string

bq24007
bq24008

SLUS479D – JANUARY 2001 – REVISED NOVEMBER 2004

Charge current feedback, applied through pin ISNS, maintains regulation around a threshold of $V_{(lim)}$. The following formula calculates the value of the sense resistor:

$$R_{(SNS)} = \frac{V_{(lim)}}{I_{(REG)}}$$

where I_{REG} is the desired charging current.

Voltage Monitoring and Regulation

Voltage regulation feedback is through pin VSENSE. This input is tied directly to the positive side of the battery pack. The bq2400x supports cells with either coke (4.1 V) or graphite (4.2 V) anode. Pin VSEL selects the charge regulation voltage.

VSEL State (see Note)	CHARGE REGULATION VOLTAGE
Low	4.1 V
High	4.2 V(9.32)

DETAILED DESCRIPTION

POWER FET

The integrated transistor is a P-channel MOSFET. The power FET features a reverse-blocking Schottky diode, which prevents current flow from OUT to IN.

An internal thermal-sense circuit shuts off the power FET when the junction temperature rises to approximately 165°C. Hysteresis is built into the thermal sense circuit. After the device has cooled approximately 10°C, the power FET turns back on. The power FET continues to cycle off and on until the fault is removed.

CURRENT SENSE

The bq2400x regulates current by sensing, on the ISNS pin, the voltage drop developed across an external sense resistor. The sense resistor must be placed between the supply voltage (Vcc) and the input of the IC (IN pins).

VOLTAGE SENSE

To achieve maximum voltage regulation accuracy, the bq2400x uses the feedback on the VSENSE pin. Externally, this pin should be connected as close to the battery cell terminals as possible. For additional safety, a 10-kΩ internal pullup resistor is connected between the VSENSE and OUT pins.

TIMER ENABLE

The logic $\overline{\text{TMR EN}}$ enables or disables the charge safety timer. A low-level signal on this pin enables the timers. A high-level input disables the timers and allows the charge to operate continuously. No charge termination is provided when this input is high. Note that the preconditioning timer remains active regardless of the status of this input.

THERMAL INFORMATION

THERMALLY ENHANCED TSSOP-20

The thermally enhanced PWP package is based on the 20-pin TSSOP, but includes a thermal pad (see Figure 20) to provide an effective thermal contact between the IC and the PWB.

Traditionally, surface mount and power have been mutually exclusive terms. A variety of scaled-down TO220-type packages have leads formed as gull wings to make them applicable for surface-mount applications. These packages, however, suffer from several shortcomings: they do not address the very low profile requirements (<2 mm) of many of today's advanced systems, and they do not offer a pin-count high enough to accommodate increasing integration. On the other hand, traditional low-power surface-mount packages require power-dissipation derating that severely limits the usable range of many high-performance analog circuits.

The PWP package (thermally enhanced TSSOP) combines fine-pitch surface-mount technology with thermal performance comparable to much larger power packages.

The PWP package is designed to optimize the heat transfer to the PWB. Because of the very small size and limited mass of a TSSOP package, thermal enhancement is achieved by improving the thermal conduction paths that remove heat from the component. The thermal pad is formed using a lead-frame design (patent pending) and manufacturing technique to provide the user with direct connection to the heat-generating IC. When this pad is soldered or otherwise coupled to an external heat dissipator, high power dissipation in the ultrathin, fine-pitch, surface-mount package can be reliably achieved.

Figure 20. Views of Thermally Enhanced PWP Package

Because the conduction path has been enhanced, power-dissipation capability is determined by the thermal considerations in the PWB design. For example, simply adding a localized copper plane (heat-sink surface), which is coupled to the thermal pad, enables the PWP package to dissipate 2.5 W in free air. (Reference Figure 22(a), 8 cm² of copper heat sink and natural convection.) Increasing the heat-sink size increases the power dissipation range for the component. The power dissipation limit can be further improved by adding airflow to a PWB/IC assembly. (See 71 0 TD1(22(a),4.08ermal p TD 0 8 c -0

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

THERMAL PAD MECHANICAL

This package incorporates an exposed thermal pad that is designed to be attached directly to a heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). The PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be

attached to a special heatsink structure designed into the PCB. This design optimizes thermal performance.

For information on the Quad Flatpack No-Lead (QFN) package, see the QFN package drawing.

NOTE: All linear dimensions are in millimeters

Non Solder Mask

NOTES:

- 1. Recommended for use on boards that will be soldered to a PCB. Refer to Application Note, QFN
- 2. For specific thermal information, via requirements, refer to the QFN package data sheet.
- 3. Laser cutting apertures with trapezoidal walls and rounded corners is recommended for improved dross resistance.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
