

## Device Overview

The 89HPES24N3A is a member of the IDT PRECISE™ family of PCI Express® switching solutions. The PES24N3A is a 24-lane, 3-port peripheral chip that performs PCI Express packet switching with a feature set optimized for high performance applications such as servers, storage, and communications/networking. It provides connectivity and switching functions between a PCI Express upstream port and two downstream ports and supports switching between downstream ports.

## Features

- ◆ **High Performance PCI Express Switch**
  - Twenty-four 2.5 Gbps PCI Express lanes
  - Three switch ports
  - Upstream port configurable up to x8
  - Downstream ports configurable up to x8
  - Low-latency cut-through switch architecture
  - Support for Max Payload Size up to 2048 bytes
  - One virtual channel
  - Eight traffic classes
  - PCI Express Base Specification Revision 1.1 compliant
- ◆ **Flexible Architecture with Numerous Configuration Options**
  - Automatic per port link width negotiation to x8, x4, x2 or x1
  - Automatic lane reversal on all ports
  - Automatic polarity inversion on all lanes
  - Ability to load device configuration from serial EEPROM
- ◆ **Legacy Support**
  - PCI compatible INTx emulation
  - Bus locking
- ◆ **Highly Integrated Solution**
  - Requires no external components
  - Incorporates on-chip internal memory for packet buffering and queuing
  - Integrates twenty-four 2.5 Gbps embedded SerDes with 8B/10B encoder/decoder (no separate transceivers needed)
- ◆ **Reliability, Availability, and Serviceability (RAS) Features**
  - Supports ECRC and Advanced Error Reporting
  - Internal end-to-end parity protection on all TLPs ensures data integrity even in systems that do not implement end-to-end CRC (ECRC)
  - Supports PCI Express Native Hot-Plug, Hot-Swap capable I/O
  - Compatible with Hot-Plug I/O expanders used on PC and server motherboards

## Block Diagram

Figure 1 Internal Block Diagram

- ◆ **Power Management**
  - Utilizes advanced low-power design techniques to achieve low typical power consumption
  - Supports PCI Power Management Interface specification (PCI-PM 1.1)
    - Supports device power management states: D0, D3<sub>hot</sub> and D3<sub>cold</sub>
  - Unused SerDes are disabled
- ◆ **Testability and Debug Features**
  - Ability to read and write any internal register via the SMBus
- ◆ **Eight General Purpose Input/Output Pins**
  - Each pin may be individually configured as an input or output
  - Each pin may be individually configured as an interrupt input
  - Some pins have selectable alternate functions
- ◆ **Packaged in 27x27mm 420 ball BGA with 1mm ball spacing**

**Product Description**

Utilizing standard PCI Express interconnect, the PES24N3A provides the most efficient I/O connectivity solution for applications requiring high throughput, low latency, and simple board layout with a minimum number of board layers. It provides connectivity for up to 3 ports across 24 integrated serial lanes. Each lane provides 2.5 Gbps of bandwidth in both directions and is fully compliant with PCI Express Base specification revision 1.1.

**SMBus Interface**

The PES24N3A contains two SMBus interfaces. The slave interface provides full access to the configuration registers in the PES24N3A, allowing every configuration register in the device to be read or written by an external agent. The master interface allows the default configuration register values of the PES24N3A to be overridden following a reset with values programmed in an external serial EEPROM. The master interface is also used by an external Hot-Plug I/O expander.

Six pins make up each of the two SMBus interfaces. These pins consist of an SMBus clock pin, an SMBus data pin, and 4 SMBus address pins. In the slave interface, these address pins allow the SMBus address to which the device responds to be configured. In the master interface, these address pins allow the SMBus address of the serial configuration EEPROM from which data is loaded to be configured. The SMBus address is set up on negation of PERSTN by sampling the corresponding address pins. When the pins are sampled, the resulting address is assigned as shown in Table 1.

Bit	Slave SMBus Address	Master SMBus Address
1	SSMBADDR[1]	MSMBADDR[1]
2	SSMBADDR[2]	MSMBADDR[2]
3	SSMBADDR[3]	MSMBADDR[3]

Table 1 Master and Slave SMBus Address Assignment

Bit	Slave SMBus Address	Master SMBus Address
4	0	MSMBADDR[4]
5	SSMBADDR[5]	1
6	1	0
7	1	1

Table 1 Master and Slave SMBus Address Assignment

As shown in Figure 2, the master and slave SMBuses may be used in a unified or split configuration. In the unified configuration, shown in Figure 2(a), the master and slave SMBuses are tied together and the PES24N3A acts both as a SMBus master as well as a SMBus slave on this bus. This requires that the SMBus master or processor that has access to PES24N3A registers supports SMBus arbitration. In some systems, this SMBus master interface may be implemented using general purpose I/O pins on a processor or micro controller, and may not support SMBus arbitration. To support these systems, the PES24N3A may be configured to operate in a split configuration as shown in Figure 2(b).

In the split configuration, the master and slave SMBuses operate as two independent buses and thus multi-master arbitration is never required. The PES24N3A supports reading and writing of the serial EEPROM on the master SMBus via the slave SMBus, allowing in system programming of the serial EEPROM.

Figure 2 SMBus Interface Configuration Examples

### Hot-Plug Interface

The PES24N3A supports PCI Express Hot-Plug on each downstream port. To reduce the number of pins required on the device, the PES24N3A utilizes an external I/O expander, such as that used on PC motherboards, connected to the SMBus master interface. Following reset and configuration, whenever the state of a Hot-Plug output needs to be modified, the PES24N3A generates an SMBus transaction to the I/O expander with the new value of all of the outputs. Whenever a Hot-Plug input changes, the I/O expander generates an interrupt which is received on the IOEXPINTN input pin (alternate function of GPIO) of the PES24N3A. In response to an I/O expander interrupt, the PES24N3A generates an SMBus transaction to read the state of all of the Hot-Plug inputs from the I/O expander.

### General Purpose Input/Output

The PES24N3A provides eight General Purpose Input/Output (GPIO) pins that may be used by the system designer as bit I/O ports. Each GPIO pin may be configured independently as an input or output through software control. Some GPIO pins are shared with other on-chip functions. These alternate functions may be enabled via software, SMBus slave interface, or serial configuration EEPROM.

The PES24N3A is based on a flexible and efficient layered architecture. The PCI Express layer consists of SerDes, Physical, Data Link and Transaction layers in compliance with PCI Express Base specification Revision 1.1. The PES24N3A can operate either as a store and forward or cut-through switch and is designed to switch memory and I/O transactions. It supports eight Traffic Classes (TCs) and one Virtual Channel (VC) with sophisticated resource management to enable efficient switching and I/O connectivity for servers, storage, and embedded applications.

Figure 3 I/O Expansion Application

## Pin Description

The following tables list the functions of the pins provided on the PES24N3A. Some of the functions listed may be multiplexed onto the same pin. The active polarity of a signal is defined using a suffix. Signals ending with an "N" are defined as being active, or asserted, when at a logic zero (low) level. All other signals (including clocks, buses, and select lines) will be interpreted as being active, or asserted, when at a logic one (high) level.

**Note:** In the PES24N3A, the two downstream ports are labeled port 2 and port 4.

Signal	Type	Name/Description
PE0RP[7:0] PE0RN[7:0]	I	<b>PCI Express Port 0 Serial Data Receive.</b> Differential PCI Express receive pairs for port 0. Port 0 is the upstream port.
PE0TP[7:0] PE0TN[7:0]	O	<b>PCI Express Port 0 Serial Data Transmit.</b> Differential PCI Express transmit pairs for port 0. Port 0 is the upstream port.
PE2RP[7:0] PE2RN[7:0]	I	<b>PCI Express Port 2 Serial Data Receive.</b> Differential PCI Express receive pairs for port 2.
PE2TP[7:0] PE2TN[7:0]	O	<b>PCI Express Port 2 Serial Data Transmit.</b> Differential PCI Express transmit pairs for port 2.
PE4RP[7:0] PE4RN[7:0]	I	<b>PCI Express Port 4 Serial Data Receive.</b> Differential PCI Express receive pairs for port 4.
PE4TP[7:0] PE4TN[7:0]	O	<b>PCI Express Port 4 Serial Data Transmit.</b> Differential PCI Express transmit pairs for port 4.
PEREFCLKP[2:1] PEREFCLKN[2:1]	I	<b>PCI Express Reference Clock.</b> Differential reference clock pair input. This clock is used as the reference clock by on-chip PLLs to generate the clocks required for the system logic and on-chip SerDes. The frequency of the differential reference clock is determined by the REFCLKM signal.
REFCLKM	I	<b>PCI Express Reference Clock Mode Select.</b> This signal selects the frequency of the reference clock input. 0x0 - 100 MHz 0x1 - 125 MHz

Table 2 PCI Express Interface Pins

Signal	Type	Name/Description
MSMBADDR[4:1]	I	<b>Master SMBus Address.</b> These pins determine the SMBus address of the serial EEPROM from which configuration information is loaded.
MSMBCLK	I/O	<b>Master SMBus Clock.</b> This bidirectional signal is used to synchronize transfers on the master SMBus. It is active and generating the clock only when the EEPROM or I/O Expanders are being accessed.
MSMBDAT	I/O	<b>Master SMBus Data.</b> This bidirectional signal is used for data on the master SMBus.
SSMBADDR[5,3:1]	I	<b>Slave SMBus Address.</b> These pins determine the SMBus address to which the slave SMBus interface responds.
SSMBCLK	I/O	<b>Slave SMBus Clock.</b> This bidirectional signal is used to synchronize transfers on the slave SMBus.
SSMBDAT	I/O	<b>Slave SMBus Data.</b> This bidirectional signal is used for data on the slave SMBus.

Table 3 SMBus Interface Pins

Signal	Type	Name/Description
GPIO[0]	I/O	<b>General Purpose I/O.</b> This pin can be configured as a general purpose I/O pin. Alternate function pin name: P2RSTN Alternate function pin type: Output Alternate function: Reset output for downstream port 2
GPIO[1]	I/O	<b>General Purpose I/O.</b> This pin can be configured as a general purpose I/O pin. Alternate function pin name: P4RSTN Alternate function pin type: Output Alternate function: Reset output for downstream port 4
GPIO[2]	I/O	<b>General Purpose I/O.</b> This pin can be configured as a general purpose I/O pin. Alternate function pin name: IOEXPINTN0 Alternate function pin type: Input Alternate function: I/O Expander interrupt 0 input
GPIO[3]	I/O	<b>General Purpose I/O.</b> This pin can be configured as a general purpose I/O pin.
GPIO[4]	I/O	<b>General Purpose I/O.</b> This pin can be configured as a general purpose I/O pin. Alternate function pin name: IOEXPINTN2 Alternate function pin type: Input Alternate function: I/O Expander interrupt 2 input
GPIO[5]	I/O	<b>General Purpose I/O.</b> This pin can be configured as a general purpose I/O pin.
GPIO[6]	I/O	<b>General Purpose I/O.</b> This pin can be configured as a general purpose I/O pin.
GPIO[7]	I/O	<b>General Purpose I/O.</b> This pin can be configured as a general purpose I/O pin. Alternate function pin name: GPEN Alternate function pin type: Output Alternate function: General Purpose Event (GPE) output

Table 4 General Purpose I/O Pins

Signal	Type	Name/Description
CCLKDS	I	<b>Common Clock Downstream.</b> When the CCLKDS pin is asserted, it indicates that a common clock is being used between the downstream device and the downstream port.
CCLKUS	I	<b>Common Clock Upstream.</b> When the CCLKUS pin is asserted, it indicates that a common clock is being used between the upstream device and the upstream port.
MSMBSMODE	I	<b>Master SMBus Slow Mode.</b> The assertion of this pin indicates that the master SMBus should operate at 100 KHz instead of 400 KHz. This value may not be overridden.

Table 5 System Pins (Part 1 of 2)

Signal	Type	Name/Description
PERSTN	I	<b>Fundamental Reset.</b> Assertion of this signal resets all logic inside PES24N3A and initiates a PCI Express fundamental reset.
RSTHALT	I	<b>Reset Halt.</b> When this signal is asserted during a PCI Express fundamental reset, PES24N3A executes the reset procedure and remains in a reset state with the Master and Slave SMBuses active. This allows software to read and write registers internal to the device before normal device operation begins. The device exits the reset state when the RSTHALT bit is cleared in the SWCTL register by an SMBus master.
SWMODE[3:0]	I	<b>Switch Mode.</b> These configuration pins determine the PES24N3A switch operating mode. 0x0 - Normal switch mode 0x1 - Normal switch mode with Serial EEPROM initialization 0x2 - through 0xF Reserved

Table 5 System Pins (Part 2 of 2)

Signal	Type	Name/Description
JTAG_TCK	I	<b>JTAG Clock.</b> This is an input test clock used to clock the shifting of data into or out of the boundary scan logic or JTAG Controller. JTAG_TCK is independent of the system clock with a nominal 50% duty cycle.
JTAG_TDI	I	<b>JTAG Data Input.</b> This is the serial data input to the boundary scan logic or JTAG Controller.
JTAG_TDO	O	<b>JTAG Data Output.</b> This is the serial data shifted out from the boundary scan logic or JTAG Controller. When no data is being shifted out, this signal is tri-stated.
JTAG_TMS	I	<b>JTAG Mode.</b> The value on this signal controls the test mode select of the boundary scan logic or JTAG Controller.
JTAG_TRST_N	I	<b>JTAG Reset.</b> This active low signal asynchronously resets the boundary scan logic and JTAG TAP Controller. An external pull-up on the board is recommended to meet the JTAG specification in cases where the tester can access this signal. However, for systems running in functional mode, one of the following should occur: 1) actively drive this signal low with control logic 2) statically drive this signal low with an external pull-down on the board

Table 6 Test Pins

Signal	Type	Name/Description
V <sub>DD</sub> CORE	I	<b>Core V<sub>DD</sub>.</b> Power supply for core logic.
V <sub>DD</sub> IO	I	<b>I/O V<sub>DD</sub>.</b> LVTTTL I/O buffer power supply.
V <sub>DD</sub> PE	I	<b>PCI Express Digital Power.</b> PCI Express digital power used by the digital power of the SerDes.

Table 7 Power and Ground Pins

Signal	Type	Name/Description
V <sub>DD</sub> APE	I	PCI Express Analog Power. PCI Express analog power used by the PLL and bias generator.
V <sub>TT</sub> PE	I	PCI Express Termination Power.
V <sub>SS</sub>	I	Ground.

Table 7 Power and Ground Pins

## Pin Characteristics

**Note:** Some input pads of the PES24N3A do not contain internal pull-ups or pull-downs. Unused inputs should be tied off to appropriate levels. This is especially critical for unused control signal inputs which, if left floating, could adversely affect operation. Also, any input pin left floating can cause a slight increase in power consumption.

Function	Pin Name	Type	Buffer	I/O Type	Internal Resistor <sup>1</sup>	Notes
PCI Express Interface	PE0RN[7:0]	I	CML	Serial link

## System Clock Parameters

Values based on systems running at recommended supply voltages and operating temperatures, as shown in Tables 13 and 14.

Parameter	Description	Min	Typical	Max	Unit
Refclk <sub>FREQ</sub>	Input reference clock frequency range	100		125 <sup>1</sup>	MHz
Refclk <sub>DC</sub> <sup>2</sup>	Duty cycle of input clock	40	50	60	%
T <sub>R</sub> , T <sub>F</sub>	Rise/Fall time of input clocks			0.2*RCUI	RCUI <sup>3</sup>
V <sub>SW</sub>	Differential input voltage swing <sup>4</sup>	0.6		1.6	V
T <sub>jitter</sub>	Input clock jitter (cycle-to-cycle)			125	ps
R <sub>T</sub>	Termination Resistor		110		Ohms

**Table 9 Input Clock Requirements**

<sup>1</sup> The input clock frequency will be either 100 or 125 MHz depending on signal REFCLKM.

<sup>2</sup> CLKIn must be AC coupled. Use 0.01 — 0.1 μF ceramic capacitors.

<sup>3</sup> RCUI (Reference Clock Unit Interval) refers to the reference clock period.

<sup>4</sup> AC coupling required.

## AC Timing Characteristics

Parameter	Description	Min <sup>1</sup>	Typical <sup>1</sup>	Max <sup>1</sup>	Units
<b>PCIe Transmit</b>					
UI	Unit Interval	399.88	400	400.12	ps
T <sub>TX-EYE</sub>	Minimum Tx Eye Width	0.7	.9		UI
T <sub>TX-EYE-MEDIAN-to-MAX-JITTER</sub>	Maximum time between the jitter median and maximum deviation from the median			0.15	UI
T <sub>TX-RISE</sub> , T <sub>TX-FALL</sub>	D+ / D- Tx output rise/fall time	50	90		ps
T <sub>TX-IDLE-MIN</sub>	Minimum time in idle	50			UI
T <sub>TX-IDLE-SET-TO-IDLE</sub>	Maximum time to transition to a valid Idle after sending an Idle ordered set			20	UI
T <sub>TX-IDLE-TO-DIFF-DATA</sub>	Maximum time to transition from valid idle to diff data			20	UI
T <sub>TX-SKEW</sub>	Transmitter data skew between any 2 lanes		500	1300	ps
<b>PCIe Receive</b>					
UI	Unit Interval	399.88	400	400.12	ps
T <sub>RX-EYE (with jitter)</sub>	Minimum Receiver Eye Width (jitter tolerance)	0.4			UI

**Table 10 PCIe AC Timing Characteristics (Part 1 of 2)**

Parameter	Description	Min <sup>1</sup>	Typical <sup>1</sup>	Max <sup>1</sup>	Units
T <sub>RX-EYE-MEDIUM TO MAX JITTER</sub>	Max time between jitter median & max deviation			0.3	UI
T <sub>RX-IDLE-DET-DIFF-ENTER TIME</sub>	Unexpected Idle Enter Detect Threshold Integration Time			10	ms
T <sub>RX-SKEW</sub>	Lane to lane input skew			20	ns

Table 10 PCIe AC Timing Characteristics (Part 2 of 2)

<sup>1</sup> Minimum, Typical, and Maximum values meet the requirements under PCI Specification 1.1

Signal	Symbol	Reference Edge	Min	Max	Unit	Timing Diagram Reference
<b>GPIO</b>						
GPIO[7:0] <sup>1</sup>	T <sub>pw</sub> <sup>2</sup>	None	50	—	ns	

Table 11 GPIO AC Timing Characteristics

<sup>1</sup> GPIO signals must meet the setup and hold times if they are synchronous or the minimum pulse width if they are asynchronous.

<sup>2</sup> The values for this symbol were determined by calculation, not by testing.

Signal	Symbol	Reference Edge	Min	Max	Unit	Timing Diagram Reference
<b>JTAG</b>						
JTAG_TCK	T <sub>per_16a</sub>	none	50.0	—	ns	See Figure 5.
	Thigh_16a, Tlow_16a		10.0	25.0	ns	
JTAG_TMS <sup>1</sup> , JTAG_TDI	T <sub>su_16b</sub>	JTAG_TCK rising	2.4	—	ns	
	Thld_16b		1.0	—	ns	
JTAG_TDO	T <sub>do_16c</sub>	JTAG_TCK falling	—	20	ns	
	T <sub>dz_16c</sub> <sup>2</sup>		—	20	ns	
JTAG_TRST_N	T <sub>pw_16d</sub> <sup>2</sup>	none	25.0	—	ns	

Table 12 JTAG AC Timing Characteristics

<sup>1</sup> The JTAG specification, IEEE 1149.1, recommends that JTAG\_TMS should be held at 1 while the signal applied at JTAG\_TRST\_N changes from 0 to 1. Otherwise, a race may occur if JTAG\_TRST\_N is deasserted (going from low to high) on a rising edge of JTAG\_TCK when JTAG\_TMS is low, because the TAP controller might go to either the Run-Test/Idle state or stay in the Test-Logic-Reset state.

<sup>2</sup> The values for this symbol were determined by calculation, not by testing.

Figure 5 JTAG AC Timing Waveform

## Recommended Operating Supply Voltages

Symbol	Parameter	Minimum	Typical	Maximum	Unit
V <sub>DD</sub> CORE	Internal logic supply	0.9	1.0	1.1	V
V <sub>DD</sub> I/O	I/O supply except for SerDes LVPECL/CML	3.0	3.3	3.6	V
V <sub>DD</sub> PE	PCI Express Digital Power	0.9	1.0	1.1	V
V <sub>DD</sub> APE	PCI Express Analog Power	0.9	1.0	1.1	V
V <sub>TT</sub> PE	PCI Express Serial Data Transmit Termination Voltage	1.425	1.5	1.575	V
V <sub>SS</sub>	Common ground	0	0	0	V

Table 13 PES24N3A Operating Voltages

## Power-Up Sequence

This section describes the sequence in which various voltages must be applied to the part during power-up to ensure proper functionality. For the PES24N3A, the power-up sequence must be as follows:

1. V<sub>DD</sub>I/O — 3.3V
2. V<sub>DD</sub>Core, V<sub>DD</sub>PE, V<sub>DD</sub>APE — 1.0V
3. V<sub>TT</sub>PE — 1.5V

When powering up, each voltage level must ramp and stabilize prior to applying the next voltage in the sequence to ensure internal latch-up issues are avoided. There are no maximum time limitations in ramping to valid power levels. The power-down sequence must be in the reverse order of the power-up sequence.

## Recommended Operating Temperature

Grade	Temperature
Commercial	0°C to +70°C Ambient

Table 14 PES24N3A Operating Temperatures

## Power Consumption

Typical power is measured under the following conditions: 25°C Ambient, 35% total link usage on all ports, typical voltages defined in Table 13 (and also listed below).

Maximum power is measured under the following conditions: 70°C Ambient, 85% total link usage on all ports, maximum voltages defined in Table 13 (and also listed below).

Number of active Lanes per Port		Core Supply		PCIe Digital Supply		PCIe Analog Supply		PCIe Termination Supply		I/O Supply		Total	
		Typ 1.0V	Max 1.1V	Typ 1.0V	Max 1.1V	Typ 1.0V	Max 1.1V	Typ 1.5V	Max 1.575V	Typ 3.3V	Max 3.6V	Typ Power	Max Power
8/8/8	mA	705	928	1037	1247	415	455	520	617	1	1	2.9W	3.9W
	Watts	0.705	1.02	1.037	1.37	0.415	0.50	0.78	0.97	0.003	0.004		
8/4/4	mA	676	845	873	1004	409	434	360	408	1	1	2.5W	3.2W

Table 15 PES24N3A Power Consumption

## Thermal Considerations

This section describes thermal considerations for the PES24N3A (27mm<sup>2</sup> BXG420 package). The data in Table 16 below contains information that is relevant to the thermal performance of the PES24N3A switch.

Symbol	Parameter	Value	Units	Conditions
T <sub>J(max)</sub>	Junction Temperature	125	°C	Maximum
T <sub>A(max)</sub>	Ambient Temperature	70	°C	Maximum for commercial-rated products
θ <sub>JA(effective)</sub>	Effective Thermal Resistance, Junction-to-Ambient	10.6	°C/W	Zero air flow
		8.5	°C/W	1 m/S air flow
		7.6	°C/W	2 m/S air flow
θ <sub>JB</sub>	Thermal Resistance, Junction-to-Board	6.8	°C/W	
θ <sub>JC</sub>	Thermal Resistance, Junction-to-Case	0.7	°C/W	
P	Power Dissipation of the Device	3.9	Watts	Maximum

Table 16 Thermal Specifications for PES24N3A, 27x27 mm BXG420 Package

**Note:** The parameter θ<sub>JA(eff)</sub> is not the *absolute* thermal resistance for the package as defined by JEDEC (JESD-51). Because resistance can vary with the number of board layers, size of the board, and airflow, θ<sub>JA(eff)</sub> is the *effective* thermal resistance. The values for effective θ<sub>JA</sub> given above are based on a 10-layer, standard height, full length (4.3"x12.2") PCIe add-in card.

## Heat Sink

Table 17 lists heat sink requirements for the PES24N3A under three common usage scenarios. As shown in this table, a heat sink is not required in most cases.

Air Flow	Board Size	Board Layers	Heat Sink Requirement
Zero	3.9"x6.2" (ExpressModule form factor) or larger	10 or more	No heat sink required
Zero	Any	14 or more	No heat sink required
1 m/S or more	Any	Any	No heat sink required

Table 17 Heat Sink Requirements Based on Air Flow and Board Characteristics

## Thermal Usage Examples

The junction-to-ambient thermal resistance is a measure of a device's ability to dissipate heat from the die to its surroundings in the absence of a heat sink. The general formula to determine  $\theta_{JA}$  is:

$$\theta_{JA} = (T_J - T_A) / P$$

Thermal reliability of a device is generally assured when the actual value of  $T_J$  in the specific system environment being considered is less than the maximum  $T_J$  specified for the device. Using an ambient temperature of 70°C and assuming a system with 1m/S airflow, the actual value of  $T_J$  is:

$$T_{J(actual)} = T_A + P * \theta_{JA(eff)} = 70^\circ C + 3.9W * 8.5W^\circ C = 103^\circ C$$

The actual  $T_J$  of 103°C is well below the maximum  $T_J$  of 125°C specified for the device (shown in Table 16). Therefore, no heat sink is needed in this scenario. The formula is also useful from a system design perspective. It can be used to determine if a heat sink should be added to the device based on some desired value of  $T_J$ . For example, if for reliability purposes the desired  $T_J$  is 100°C, then the maximum allowable  $T_A$  is:

$$T_{A(allowed)} = T_{J(desired)} - (P * \theta_{JA(effective)})$$

$$T_{A(allowed)} = 100^\circ C - (3.9W * 8.5W^\circ C) = 100^\circ C - 33^\circ C = 67^\circ C$$

An appropriate level of increased air flow and/or a heat sink can be added to achieve this lower ambient temperature. Please contact [ssdhelp@idt.com](mailto:ssdhelp@idt.com) for further assistance.

## DC Electrical Characteristics

Values based on systems running at recommended supply voltages, as shown in Table 13.

Note: See Table 8, Pin Characteristics, for a complete I/O listing.

I/O Type	Parameter	Description	Min <sup>1</sup>	Typ <sup>1</sup>	Max <sup>1</sup>	Unit	Conditions
Serial Link	PCIe Transmit						
	V <sub>TX-DIFFp-p</sub>	Differential peak-to-peak output voltage	800		1200	mV	
	V <sub>TX-DE-RATIO</sub>	De-emphasized differential output voltage	-3		-4	dB	
	V <sub>TX-DC-CM</sub>	DC Common mode voltage	-0.1	1	3.7	V	
	V <sub>TX-CM-ACP</sub>	RMS AC peak common mode output voltage			20	mV	
	V <sub>TX-CM-DC-active-idle-delta</sub>	Abs delta of DC common mode voltage between L0 and idle			100	mV	
	V <sub>TX-CM-DC-line-delta</sub>	Abs delta of DC common mode voltage between D+ and D-			25	mV	
V <sub>TX-Idle-DIFFp</sub>	Electrical idle diff peak output			20	mV		
Serial Link (cont.)	V <sub>TX-RCV-Detect</sub>	Voltage change during receiver detection			600	mV	
	RL <sub>TX-DIFF</sub>	Transmitter Differential Return loss	12			dB	
	RL <sub>TX-CM</sub>	Transmitter Common Mode Return loss	6			dB	
	Z <sub>TX-DEFF-DC</sub>	DC Differential TX impedance	80	100	120	Ω	
	Z <sub>OSE</sub>	Single ended TX Impedance	40	50	60	Ω	
	Transmitter Eye Diagram	TX Eye Height (De-emphasized bits)	505	650		mV	
	Transmitter Eye Diagram	TX Eye Height (Transition bits)	800	950		mV	
	PCIe Receive						
	V <sub>RX-DIFFp-p</sub>	Differential input voltage (peak-to-peak)	175		1200	mV	
	V <sub>RX-CM-AC</sub>	Receiver common-mode voltage for AC coupling			150	mV	
	RL <sub>RX-DIFF</sub>	Receiver Differential Return Loss	15			dB	
	RL <sub>RX-CM</sub>	Receiver Common Mode Return Loss	6			dB	
	Z <sub>RX-DIFF-DC</sub>	Differential input impedance (DC)	80	100	120	Ω	
	Z <sub>RX-COMM-DC</sub>	Single-ended input impedance	40	50	60	Ω	
Z <sub>RX-COMM-HIGH-Z-DC</sub>	Powered down input common mode impedance (DC)	200k	350k		Ω		
V <sub>RX-IDLE-DET-DIFFp-p</sub>	Electrical idle detect threshold	65		175	mV		
PCIe REFCLK							
	C <sub>IN</sub>	Input Capacitance	1.5	—		pF	

Table 18 DC Electrical Characteristics (Part 1 of 2)

I/O Type	Parameter	Description	Min <sup>1</sup>	Typ <sup>1</sup>	Max <sup>1</sup>	Unit	Conditions
<b>Other I/Os</b>							
LOW Drive Output	$I_{OL}$		—	2.5	—	mA	$V_{OL} = 0.4v$
	$I_{OH}$		—	-5.5	—	mA	$V_{OH} = 1.5V$
High Drive Output	$I_{OL}$		—	12.0	—	mA	$V_{OL} = 0.4v$
	$I_{OH}$		—	-20.0	—	mA	$V_{OH} = 1.5V$
Schmitt Trigger Input (STI)	$V_{IL}$		-0.3	—	0.8	V	—
	$V_{IH}$		2.0	—	$V_{DD}/O + 0.5$	V	—
Input	$V_{IL}$		-0.3	—	0.8	V	—
	$V_{IH}$		2.0	—	$V_{DD}/O + 0.5$	V	—
Capacitance	$C_{IN}$		—	—	8.5	pF	—
Leakage	Inputs		—	—	$\pm 10$	$\mu A$	$V_{DD}/O$ (max)
	$I/O_{LEAK}$ w/o Pull-ups/downs		—	—	$\pm 10$	$\mu A$	$V_{DD}/O$ (max)
	$I/O_{LEAK}$ WITH Pull-ups/downs		—	—	$\pm 80$	$\mu A$	$V_{DD}/O$ (max)

Table 18 DC Electrical Characteristics (Part 2 of 2)

<sup>1</sup>: Minimum, Typical, and Maximum values meet the requirements under PCI Specification 1.1.

## Package Pinout — 420-BGA Signal Pinout for PES24N3A

The following table lists the pin numbers and signal names for the PES24N3A device.

Pin	Function	Alt	Pin	Function	Alt	Pin	Function	Alt	Pin	Function	Alt
A1	V <sub>SS</sub>		B9	MSMBDAT		C17	V <sub>DDIO</sub>		D25	V <sub>SS</sub>	
A2	V <sub>SS</sub>		B10	SSMBADDR_2		C18	V <sub>SS</sub>		D26	PEREFCLKN2	
A3	V <sub>SS</sub>		B11	SSMBADDR_5		C19	V <sub>DDIO</sub>		E1	V <sub>SS</sub>	
A4	JTAG_TDI		B12	SSMBDAT		C20	V <sub>SS</sub>		E2	V <sub>SS</sub>

DESCRIPTION		APPROVED
INITIAL RELEASE		

NOTES:

- 1 ALL DIMENSIONING AND TOLERANCING CONFORM TO ANSI Y14.5M-1982
- 2 "e" REPRESENTS THE BASIC SOLDER BALL GRID PITCH
- 3 "M" REPRESENTS THE MAXIMUM SOLDER BALL MATRIX SIZE
- 4 "N" REPRESENTS THE BALLCOUNT NUMBER
- 5 DIMENSION "b" IS MEASURED AT THE MAXIMUM SOLDER BALL DIAMETER, PARALLEL TO PRIMARY DATUM  $\square$ -C-
- 6 SEATING PLANE AND PRIMARY DATUM  $\square$ -C- ARE DEFINED BY THE SPHERICAL CROWNS OF THE SOLDER BALLS
- 7 "A1" ID CORNER MUST BE IDENTIFIED BY CHAMFER, INK MARK, METALLIZED MARKING, INDENTATION OR OTHER FEATURE ON PACKAGE BODY
- 8 EXACT SHAPE OF EACH CORNER IS OPTIONAL
- 9 ALL DIMENSIONS ARE IN MILLIMETERS

## Revision History

**February 8, 2007:** Initial publication.

**April 4, 2007:** In Table 3, revised description for MSMBCLK signal.

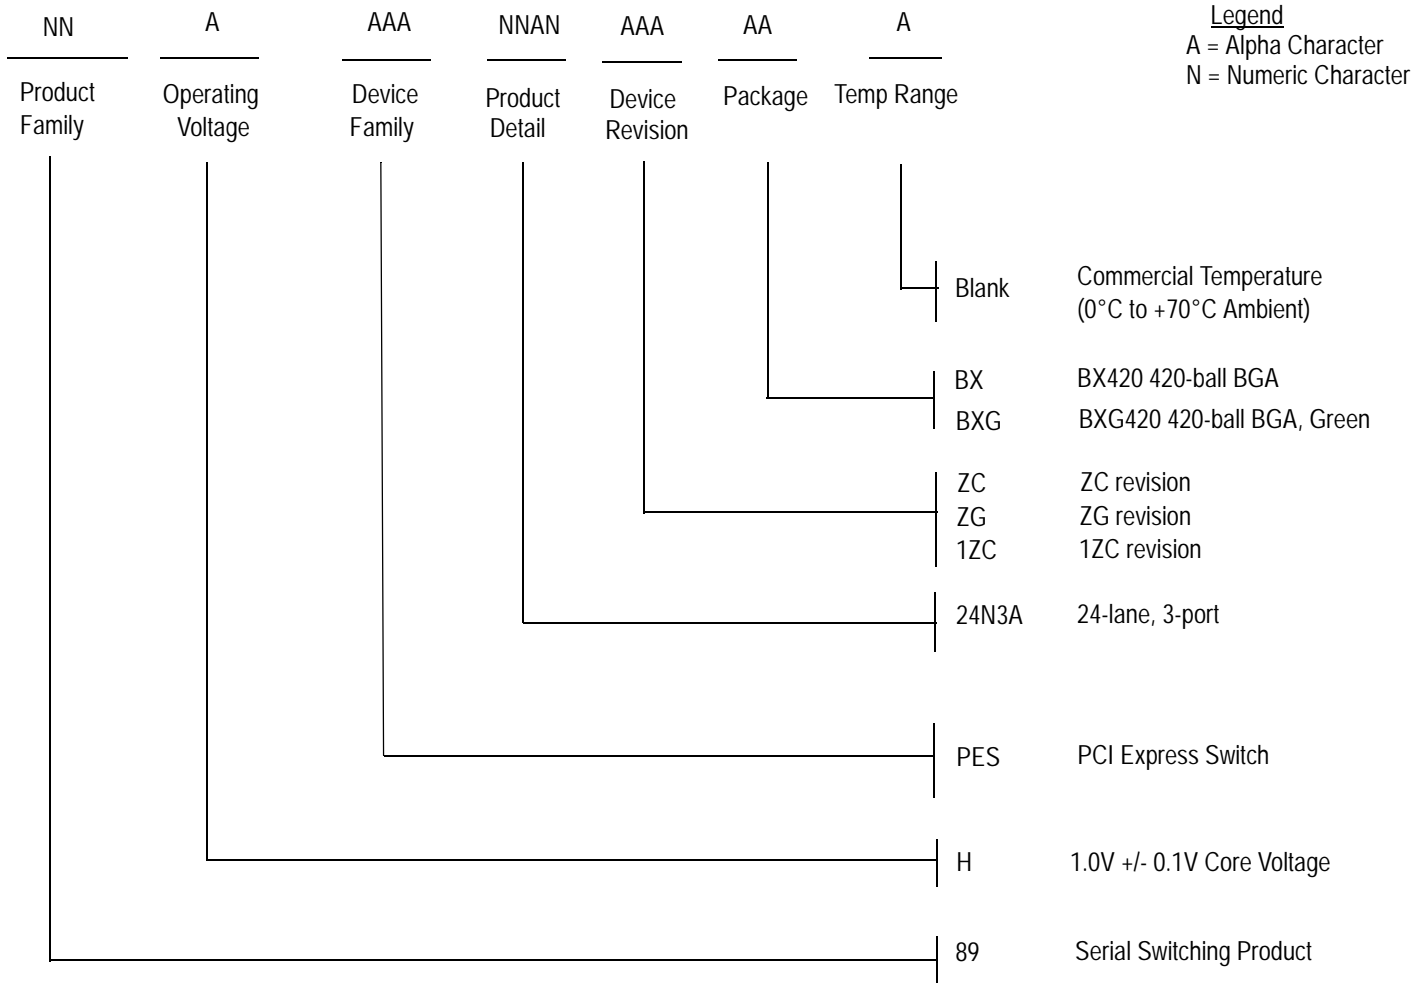

**May 30, 2007:** Added ZG device revision to Ordering Information.

**November 14, 2007:** Added new parameter, Termination Resistor, to Table 9, Input Clock Requirements.

**March 25, 2008:** Added  $\theta_{JB}$  and  $\theta_{JC}$  parameters to Table 16, Thermal Specifications.

**April 23, 2008:** Added 1ZC device revision to Ordering Information.

## Ordering Information

**Legend**  
 A = Alpha Character  
 N = Numeric Character

### Valid Combinations

- 89HPES24N3AZCBX 420-pin BX420 package, Commercial Temperature
- 89HPES24N3AZGBX 420-pin BX420 package, Commercial Temperature
- 89HPES24N3A1ZCBX 420-pin BX420 package, Commercial Temperature
- 89HPES24N3AZCBXG 420-pin Green BX420 package, Commercial Temperature
- 89HPES24N3AZGBXG 420-pin Green BX420 package, Commercial Temperature
- 89HPES24N3A1ZCBXG 420-pin Green BX420 package, Commercial Temperature
